Generated task
Question: Using lab results from Jan 5 and Jan 21, 2024, assess changes in blood glucose and lipids and implications for health management. Support your assessment with observations and diagnoses.
Candidate answer: No further glucose abnormalities were recorded on Jan 21, suggesting that glucose was controlled to some extent.
Evidence verification
Task claim: Condition/2402 is "hyperglycemia".
Source record: hyperlipidemia (ICD-10-CM E78.5).
Result: failed. The source record does not support this evidence claim.
Round feedback
Missing follow-up glucose results cannot support the claim that "glucose was controlled".
Strategy update
Testing and risk stratification: integrate baseline and follow-up data only when comparable; qualify conclusions when evidence is missing.
All direction weights remain 1 in this round.
Updated generation guidance
For longitudinal-change tasks, first confirm comparable data: the same measure and unit, similar testing conditions, and clear baseline and follow-up times. Without follow-up results, do not infer "controlled", "improved", or "worsened".
